

Voice DNA, Explained

How Content Brain captures the way you sound, and how to put it to work.

Voice DNA is a written portrait of how you actually sound, built from your own words, so anything written from here on sounds like **you** and not a generic robot. It is the centerpiece of your Content Brain.

The four notes

They live in your `voice/` folder.

- › **Brand Voice DNA** — how your business sounds in public: what you stand for, the messages you repeat, your signature words, your tone, and your concrete do's and don'ts.
- › **Personal Voice DNA** — how you sound as yourself, the looser this-is-just-me register. Built only if you told us your personal voice is different from your brand.
- › **Written Voice** — how you write, pulled from your real writing: your sentence shapes, how you open and close a piece, your punctuation habits, the phrases you reach for, and your recurring moves. Backed by real lines quoted straight from your work.
- › **Spoken Voice** — how you talk, pulled from your transcripts: your words-per-minute, your signature phrases (with counts, like a line you say 14 times), your natural filler and rhythm, and how you walk to a point.

Why written and spoken are kept separate

People do not write the way they talk. The pace, the phrases, and the sentence shapes are different. Keeping both means anything made for the page sounds like your writing, and anything scripted for video or audio sounds like you out loud.

It is built from evidence, not guesses

Every trait is backed by real lines pulled from your own content, and you confirmed each portrait before it was saved. Nothing was invented. If the evidence was thin somewhere, it said so rather than making something up.

How to use it

- › Paste a Voice DNA note into any AI as the "write in this voice" instruction.
- › Hand it to a ghostwriter or team member so they can match you.

- › Check anything drafted against it before it goes out the door.

It gets sharper over time. As you add more content, the picture tightens. If a trait ever feels off, just edit the note directly. It is your file.

Content Brain runs on your own Mac. It asks before it touches anything.
