

Your Content Vault

What Content Brain builds you, and how to actually use it.

When Content Brain finishes, you have a **vault**: one folder on your Mac that holds everything you've ever made, organized and connected. It opens in a free app called Obsidian. Here is how to find your way around it.

What Obsidian is

Obsidian is a free app where every note is just a plain-text file sitting on your Mac. The notes link to each other to form one connected map of your work. Because it is all plain text, it is yours forever: no cloud, no lock-in, and it works offline.

The map of your vault

- › **Home** and **index** — your starting point and the map of everything, organized by theme.
- › **sources/** — everything you have made: your articles, videos, podcast episodes, books, and the full text transcripts of all your audio and video.
- › **voice/** — your **Voice DNA**: how you write and how you talk, on file.
- › **concepts/** — your pillars: the handful of big themes and frameworks you are known for. Click one and see everything you have ever made about it.
- › **entities/** — the people, brands, and products that show up across your work.
- › **systems/**, **builds/**, **prompts/** — room to grow: how-you-work notes, projects, and reusable prompts.
- › **log** — a running record of what was built and when.

How it is all connected

Every piece of content is tagged to your pillars and linked to related notes. In Obsidian's graph view it looks like a web. In practice: click a pillar and every video, article, and episode that touches it appears. Jump from a video straight to its transcript and back. Nothing you have made is ever lost in a pile again.

How to use it day to day

- › Search everything you have ever made at once.
- › Click a theme to pull up all your material on it before you write or record.
- › Find that line you know you said somewhere, now it is searchable text.

- › Hand any of it to a writer, a team member, or an AI as real source material.

It is yours. Plain files, offline, no subscription. Back it up like any other folder, move it, or delete anything in it anytime.

Content Brain runs on your own Mac. It asks before it touches anything.
